## Chapter 048, Kangaroo Rat (American College of Laboratory Animal Medicine) Mark Suckow

NOTE: This is a single chapter excerpted from the book *The Laboratory Rabbit, Guinea Pig, Hamster, and Other Rodents*, made available for individual purchase. Additional chapters, as well as the entire book, may be purchased separately.

The kangaroo rat is a member of the order Rodentia and family Heteromyidae. The Merriam's kangaroo rat and the Bannertail kangaroo rat are the most commonly studied species. The name “kangaroo rat” originates from descriptions of this animal's hind limb structure and characteristic hopping patterns. The kangaroo rat's hind legs and feet are long and powerful, especially the skull. Unlike other members of the family Heteromyidae, the cheek teeth of *Dipodomys* (kangaroo rats) grow continuously. Kangaroo rats have external fur-lined cheek pouches, as well as dermal sebaceous glands that are located in the intrascapular region of the back. The chapter further studies the nutrition, diseases, uses in research, and laboratory care of the kangaroo rat.
